Hi guys anyone setting up for the aforementioned TV please? Thank you very much Hi, I have a similar Toshiba 65V6763DA. I set the following values: Cinema, Contrast 100, Helligkeit / Brightness 65, Farbe / Color 60, Sherfe / Sharpness 0, Energie sparen aus / Energy Saving, Hintergrundbeleuchtung / Light Background 85, Dynamischer Kontrast mittel / Dynamic Contrast mid, Rauschunterdrückung niedrig, Farbperatur, Farbdeckung 0, Film-Modus Auto. Used test shot First-CheckHD.jpg Yargen Discussion Starter - #1 August 4, 2011 It's interesting to hear what others found to be optimal image settings for the Toshiba 46G310U. Thank you! So I like I can pick up one today. I'll check here. Do you use this TV for gaming? How's the backlog? I can't help you with the image settings. My unit has poor flash lighting in the top left corner. Black levels are pretty well viewed, and the shady details seem in order. Other details of the image quality are in order. There is some banding visible from time to time and color uniformity, although not perfect, not bad. I see some uneven lighting in other corners, and if they were all like that, I could live with it, but the top left corner of the flash of light is scary. Now I have to decide whether I will return it and try another or cut my loss and pony for plasma rather than. No matter how long you've had a TV, chances are it might look better than it does. If you've never adjusted your TV image settings, you're overlooking peak performance. This handy guide will take you through every step to get your TV looking for its absolute best. Accommodation and connections If you have just bought a TV, consider checking where the best place is for it. Maybe it's not the most obvious place. For example, don't mount it over the fireplace. 1080i and 1080p Jeffrey Morrison/CNET Next, make sure you have the right cables. All high-speed HDMI cables work the same way, so we recommend checking places like Amazon or Monoprice (or other online stores) for cheap HDMI cable options. You probably don't need new HDMI cables to make HDR, and you don't need to worry about HDMI 2.1. Generally, HDMI is the best choice, although sometimes DVI or DisplayPort are options. Very rarely, spending a little more on certain cables is worth it. If you connect to a cable or satellite box, most of the time you should install the box to 1080i, but with some 720p TVs is better. Remember that the 1080i is the same resolution as 1080p. That's what you need to make sure you get Ultra HD 4K and HDR. Although keep in mind that not all HDR TVs are really HDR. For audio, if you connect to a sound or other sound system, it is usually either optical or There are pros and cons for everyone. If you purchased a 4K TV and you have an AV receiver, you may need to upgrade it as well. There are also certain steps you may need to take to get the sound out of your TV TV apps Etc.) to the sound bar or receiver. Many new Dolby Atmos movies that you can also get at home. Sarah Tew/CNET image Settings if you haven't adjusted any of your TV settings before, check out How to set up HDTV and HDTV settings explained. Now, with a general idea of what's going on, but before you start messing around with TV settings, it's best to choose the right image mode like Sports, Bright, Movie or Movie. With this set, the easy place to start is How to set the TV on the eye. Using only TV shows (or your own images), you should be able to get the contrast of your TV and the brightness of the controls pretty close. A slight improvement turns down the sharpness control. No really. That's why. You don't need an external converter to watch 4K on your 4K TV. Your TV transforms everything into its own. Installing a TV in the eye. Original image and modification: Jeffrey Morrison/CNET Dig Deeper: Advanced Adjustments Read to go a little further? First brush on Behind the Basic TV Settings. It covers things like backlighting, color temperature, speed upgrades and more. You may not see the entire image either, thanks to a thing called Overscan. Here's how to fix it. If you're a gamer, you definitely want to learn about a game mode that could potentially improve your online game scores with a simple click setting. If you bought a 4K TV, there are some special considerations to consider when connecting one to your computer. Don't sweat it if you're watching a movie and there are black stripes at the top and bottom of the screen; it's normal and actually right. If you want to go even further, it's time to get a setup drive for Blu-ray. They will help you find the best settings for your particular TV. And for the last step to get the push up every bit of accuracy and performance from your TV, you may want to consider a professional calibration. Troubleshooting If the voices you hear don't match the actor's lip movements, it's called a lip sync error, and sometimes you can do something about it. If you're annoyed with reflections on your TV, check out How to get rid of HDTV's reflections. There are different HDR formats you can find more about them here: HDR10 vs. Dolby Vision vs. HLG: How do HDR formats compare? If you notice that objects blur when they move, or if all you look super-smooth and looks like it on a cheap soap opera, check out what is the soap opera effect. If you don't like the blur of movement but don't like the soap opera effect, some TVs have a feature called black frame insert, which can help eliminate movement blur (but sometimes cause their own side effects). Does the image on your TV sometimes fall apart into little Actually, it's not your TV's fault. Because sometimes HD isn't really HD. And don't forget to get the most out of your new 4K TV, you need to watch 4K content. Here's where you can find all the latest and that's where to find HDR content (and that's why 4K TVs can help old HD programs, but a little bit). So what you have: almost every article I've published on how to optimize and understand your TV. Now it's time to put your feet up and enjoy. Editors' Note, December 2017: This article was originally published in 2014, but has been updated to include additional relevant links and additional installation information. Do you have a question for Jeff? First, check out all the other articles he has written on topics such as why all HDMI cables are the same, LED LCD vs. OLED vs. plasma, why 4K TVs aren't worth it and more. Do you still have a question? Email him! It won't tell you what TV to buy, but it can use your email in a future article. You can also send him a message on Twitter @TechWriterGeoff or Google and check out his travel photos on Instagram. Watching a state-of-the-art TV with the wrong settings included, like driving a Ferrari with bald tires: you don't get the full potential out of your purchase. Read more: Cheap TV deals with the latest 4K ultra-HD TVs, there are often bewildering welter options and pre-installed modes that can make it difficult to find just the right settings. Fortunately, it doesn't take much to get a better performance from your TV. Here's how to do it. Do I need to hire a professional? To get an absolute better image, your TV must be configured or calibrated for a specific room. But calibration, in its strictest definition, requires professional test equipment (e.g., the color of the Klein K-10A or X-Rite i1 Basic Pro 2 Spectrotometer), proper training and, as a rule, access to special installation codes used by installers. It also entails creating at least two custom viewing modes to accommodate specific lighting situations - for example, one that works for night viewing and the other in the daytime. (Image credit: K-10A coloring; photo credit: Klein Instruments) Fortunately, you don't need to buy on thousands of dollars of test equipment or spend hundreds hiring a professional calibrator. Today, most TVs come with at least one set picture mode, which provides surprisingly precise colors and contrast and will be enough for the average viewing situation. High-quality brands have been very well calibrated over the past five years, said Ray Soneira, founder and CEO of DisplayMate Technologies, an independent testing and consulting firm. Soneira has been at the forefront of TV testing for decades and is the author of one of the first monitor testing programs, DisplayMate. For most home viewing situations, professional calibration is not necessary, he said. Rather, all you need is a little knowledge -- and our wise advice to get the best TV picture for a great game or a big movie evening. What do the modes of a given picture mean, and which are better? MODEBEST FORWORST FORMovie/CinemaMost situationsBright roomsSportsBars and Man CaveAll elseVivid/DynamicBest Buy salonsAll, there are at least four different modes of preset video or settings on most 4K TVs: Movies, Sports, Game and and and What is embarrassing is that the terminology for these modes varies between manufacturers; for example, Vivid mode is sometimes called dynamic mode or standard mode. Movie mode is the most accurate mode out of the box, said Soneira Oklu, a quality engineer at Samsung. This means that the TV is installed in the factory to reproduce the official specifications of the picture (e.g. Rec. 709 and 2.2 gamma for HD) as close as possible to the picture that the director or director originally intended. Many manufacturers offer a variety of other saved presets in the Picture or Video menu of their TVs. Other manufacturers can refer to the same mode as Cinema mode (LG and Sony) or calibrated or calibrated dark mode (Vizio). As the item suggests, this is an ideal mode for watching movies, with one caveat: movie modes tend to reduce overall brightness to improve contrast, but in a brightly lit room, muted shades may look blurred for some viewers. However, image preferences are still subjective, and not everyone needs a strictly accurate picture, Soneira said. Consequently, many manufacturers offer a host of other saved presets in the Picture or Video menu of their TVs. Samsung, for example, also offers standard mode and natural mode: The first feels the ambience of light in the room to automatically adjust the brightness and contrast; In natural mode, the sensor is off. MORE: Samsung TV Settings Guide: What to turn on, disable and TweakAvoid Bright mode to avoid its Bright Mode or Dynamic Mode (sometimes called standard mode). This setting results in the maximum output of brightness and color parameters, blurring details and exaggerating bright colors. So why is there a bright mode? It is designed as a demonstration mode in the store to help set stand out next to dozens of other TVs in the brightly lit large store drawer. Beware: Your set can be left in Vivid mode by default. MORE: LG TV Settings Guide: What to turn on, turn off and TweakGame mode gamers want to consider switching their 4K TV to game mode before stopping for an evening of fragging. Essentially, this setting eliminates some of the video processing to do things like a smooth picture. The idea is that the game mode will reduce the input lag, which is the amount of time it takes the TV to process the image from a source such as the game console and get the image on the screen. It's relatively common for a TV to have an input lag of 60 or 100 milliseconds, such as a movie mode, but also to deliver less than 20-ms input lag with the game mode enabled. The difference is most obvious when you compete in multiplayer first-person shooters. Samsung Oklu noted, however, that one compromise game mode is a small loss of detail Should I use sports mode for a big game? Sports mode is usually for bars, Oklu said, so it will be oversaturated and raising the grass and making the picture very cool. Sports mode will also automatically adjust the sound on some of some Sets, providing more bass to create the feeling that you are in the stadium. (Other pre-installed video modes can also automatically adjust the sound on some sets.) If you have a crowd to watch the game on a sunny day, it can still be the right environment. Just remember to switch it back to movie mode after they're gone. Which options are safe to change and which should be avoided? Most TVs allow you to customize every preset to your liking. So if you prefer movie mode but find it too thin for a brightly lit living room, you can increase the brightness or contrast and keep setting. The same goes for other presets. But what settings should I focus on? Some settings have several misleading names. Brightness, for example, usually regulates the black level of the image. The lighting will lift the overall lighting system of the set. Both Soneira and Oklu were told that if you don't like the picture, you should first look at the gamma control set. This affects the contrast and is usually set at a number such as 2.2. Reducing the number will make the image brighter, but it will also make it more difficult to see the details in the highlights of the image. Raising the gamma installation to 2.4, for example, will do the opposite: reduce the severity of bright areas, but make it more difficult to see the details in the dark parts of the picture. Soneira reminded viewers that some settings have several misleading names. Brightness, for example, usually regulates the black level of the image. The lighting will lift the overall lighting system of the set. Color controls in image settings usually affect color saturation. Keep in mind that pressing these settings can make some elements of the image such as a red shirt, blooming or bleeding into the surrounding picture. Digging deeper into the picture adjustments can be a risky proposition. The expert settings you'll see - such as smooth movement, automatic movement, noise reduction and noise reduction - are unique algorithms in video set processing. Some of these options add extra footage (interpolation) to smooth the picture, but these visual tricks can also make the image look flat and lifeless like an old-fashioned soap opera. Unfortunately, many of these parameters are not well documented by TV manufacturers, so changing them can either solve problems (such as eliminating odd image artifacts) or create new ones by adding distortions. If you go down this rabbit hole, remember that it is usually a plant to reset the option to get you out of trouble. What about 4K and HDR? Your 4K TV is really three TVs in one. Soneira noted. This is because it should display programs in standard HD format, 4K ultra-HD format and 4K HDR (high range) format. On most sets, you can customize different video modes for each of these program sources - it's 12 or more presets you can set up. HDR illustration. Composite: Shutterstock, Kenneth Butler/Tom Guide Latest 4K HDR formats, such as HDR10 and Dolby Vision, contain information in the (so-called metadata) that should tell the TV exactly what to do, automatically. This format is relatively immature, and in my experience, it hasn't always worked. If you suspect that the TV has not gone into 4K or HDR mode, you will have to go to the settings to check. Make sure to HDR on, and look for a color that will be set in Native mode if it is available. Some TVs also offer HDR Boost mode. It works like an upscaling, taking standard programs and trying to enhance color and brightness, not just resolution. I found the results mixed and don't recommend using this setting. MORE: What is HDR, and what does it mean? How can I fix the picture? Soneira suggested taking a simple approach if you want to customize the picture further: Use some high-resolution still images that you're familiar with, such as snapshots of family and friends, and put them on a USB stick that you can connect to your TV. Then, when you set up the picture, you can see exactly how it affects the image. There are also several movies on 4K Blu-ray drives with HDR support. The best we've found so far is The Martian. As you make adjustments, look at the white areas of spacesuits and orange shades of the alien landscape. In addition, you can purchase test drives that contain many test models that can be used to customize the image. Among them is the \$30 Spears and Munsil HD Benchmark 2nd edition of the Blu-ray drive. Specifically, look for contrasting test patterns to help you set the right point to display as many shades of gray as possible in the picture, which in turn will be reflected in the visualization of the best details of the image.
